SELECTED TOPICS IN MATHEMATICAL LOGIC (V5A8) WS 2024-25

Tame Geometry II

Instructor. Philipp Hieronymi (hieronymi@math.uni-bonn.de)

Time and Place. Wednesdays 10am ct N0.007 Neubau

E-Campus. https://ecampus.uni-bonn.de/goto_ecampus_crs_3461374.html

Abstract. The goal of this Selected Topics course is to give an up-to-date overview of the state of the study of definable sets in expansions of the real line. In [Mil05] Miller asked what became the overarching question of this research area: "What might it mean for a first-order expansion of the real line to be tame or well behaved?" Model theorists, real-analytic geometers and more recently number-theorists(!) have focused on the o-minimal setting: an expansion of the real line is o-minimal if every definable set has finitely many connected components. However, there are now many documented examples of expansions of even the real ordered group that define sets withinfinitely many connected components, but still can be considered as tame (e.g., the topological closure of every definable set has finitely many connected components). The analysis of such expansions nowadays uses a fascinating combination of model-theoretic, metric-geometric, descriptive set-theoretic and automata-theoretic methods. In this course I plan to give an updated version of the influential, but a bit out-dated survey paper [Mil05]. I will review all basic notions and cover the most important theorems in the area. Throughout the course I will try to state as many open and approachable problems as possible, giving interested students a chance to enter this research area.

Prerequisites. Only basic knowledge of first-order logic is assumed. Participation in the course Advanced Mathematical Logic I - Tame Geometry during the Wintersemester 2024/25 is very helpful, but not strictly required. The script for that course is available on the E-Campus website for this seminar.
